

PROJECT OF GREEN BUS STOP AT LOCATION NAME

IDEA DESCRIPTION

The bus stops material is wood and glass. Because of the polish climate the bus stop must be as closed as possible. That is why we choose the glass as a material. It allows the light to pass but blocks the cold and the wind. The main idea is to use the form of a swing for the seats. This structure will have limited movement so that the glass behind will not break. Behind the glass there are wooden columns on which the plants used in this project can climb. Beside the plants other green and sustainable elements used in this project are the solar panel and the underground water container. The electricity from the solar panels will be used to illuminate the bus stop at night alongside with the light absorbing concrete. Finally for the bus stop measurements disable people were taken under consideration living a space of one will chair next to the "swing seats".
