

PROJECT OF GREEN BUS STOP AT MADRID, JUAN HERERRA ST.

IDEA DESCRIPTION

Form of our bus stop draws from mapple tree leaf, which are growing nearby the place. It suppose to introduce some greenery to concrete and asphalt area. We were trying to create space which fits especially for young people in reference to location of building in University campus. In our buss stop people can find modern solution like footstepp power generator and solar panels wich produce eletricity to charge their own gismos , timetable and led lightening at night. Moreover in answer to high temperatures in Madrid we installed button-operated mist showers, wich can help cool down people waiting on bus. That space has many seats and backrest hidden in shadow. Whole conception was projectet to be modern, arouse curiosity and perfect for instagram.
